

Assignment - 9

sort, filter, auto-filter, custom filter, advanced filter, unique records

1. how do you sort data in excel by multiple columns?
steps to sort by multiple columns in excel.

1. select your data.

- * click anywhere inside the data range
- * ensure your data has column headers

2. go to the data tab

- * go click data on the ribbon

3. click sort

- * The sort dialog box opens

4. set the first sort column

- * sort by :- choose the primary column

- * sort on :- values

- * order :- A-Z / Z-A / smallest to largest

5. Add another column

- * click Add level

- * Then by :- choose the second column

- * select the order

6. Add more columns

- * repeat Add level for additional columns

7. click ok

- * data is sorted based on the order of levels

exampler

sort employee data:-

- * first by Department (A-Z)

- * Then by salary (highest to lowest).

2. Explain the difference between auto-filter & advanced filter in excel.

* Auto-filter vs Advanced-filter in excel.

1. Auto-filter.

Auto-filter is used for quick & simple filtering of data.

Features:-

- * filter data using drop down arrows in column headers
- * supports basic conditions (text, numbers, dates)
- * easy to use, no setup required
- * filters data within the same table.

Best used when:-

- * You want to quickly find a view specific data
- * You are working with small or medium datasets.

examples:-

- * Shows all employees from IT department
- * Displays Sales greater than ₹10,000

2. Advanced-filter:- Advanced-filter is used for complex and powerful filtering.

Features:-

- * Allows multiple criteria using AND/OR logic
- * Can filter data to another location
- * Supports unique records only
- * Requires a criteria range

Best used when:-

You need complex conditions

- * You want filtered results in a separate area
- * You want to remove duplicate records

examples:-

- * employees from IT OR HR with Salary > ₹50,000
- * extract only unique customer names.

3. How would you use a custom-filter to display specific data in excel?

* using a custom-filter data based on specific conditions like equals, greater than, contains etc.

steps to Apply a custom-filter.

1. select your data.

* make sure your table has headers.

2. enable filter

* go to the data-tab

* click filter

3. click the filter arrow in the required column.

4. choose custom-filter

* for text:- Text-filters → custom-filters

* for numbers:- Number-filters → custom-filters

* for dates:- Date-filters → custom-filter.

5. set your condition.

* choose a condition (e.g., Equals, contains, greater than).

* Enter the value.

6. Add a second condition.

* use AND/OR to combine conditions.

7. click ok

* excel shows only the matching data.

Exampler

* Display employees with salary > 40,000

* Show names that contain "Raj"

* Filter dates between two dates.

Conclusion:-

* custom-filters in excel help users display only the required data by applying specific conditions, making data analysis - faster and more accurate.

4. what steps would you take to filter out duplicate records in a dataset?

method 1:- Remove duplicate records.

Steps:-

1. select the dataset:-
 - * highlight the entire data range (include headers)
2. go to the Data tab.
 - * click data on the ribbon
3. click remove duplicates
 - * In the data Tools group, click remove duplicates
4. choose columns
 - * select the columns to check for duplicates
 - * keep my data has headers checked
5. click ok
 - * excel removes duplicate records and shows a summary

method 2:- Filter duplicate records

Steps:-

1. select the data range
2. go to data → Advanced
3. choose filter the list, in place or copy to another location.
4. check unique records only
5. click ok.

method 3:- highlight duplicates

Steps:-

- * select the column or data
2. go to home → conditional formatting
3. click highlight cells rules → duplicate values
4. choose format and click ok.

5. How do you use the Advanced filter to copy filtered data to another location?

Steps to use Advanced Filter

1. Prepare your data
 - * make sure your dataset has column headers
2. create a criteria range
 - * copy the required column headers to empty cells
 - * enter the condition below the header
ex: Salary > 40000)
3. select the original data range
 - * click anywhere inside the dataset
4. go to the data tab
 - * click Data → Advanced (in sort & filter group)
5. Choose "Copy to another location"
 - * In the Advanced filter dialog box, select this option
6. set the ranges
 - * List range: your original data
 - * criteria range: The criteria you created
 - * copy to: select the destination cell.
7. click ok
 - * filtered data is copied to the new location

example:-

- * original data = employee list
- * criteria + Department = IT
- * Result = only IT employees copied to a new area.

* conclusion:-

* Advanced filter allows you to extract specific records and copy them to another location using complex conditions, making it ideal for advanced data analysis.

Q. What is the purpose of the sort & filter options in excel?

* Sort-purpose:-

Sorting helps arrange data in a specific order.

used to:-

* Arrange data A-Z or Z-A

* Sort numbers smallest to largest or, largest to smallest

* Sort dates oldest to newest or, newest to oldest

* Sort by multiple columns.

Benefit:-

* makes data easier to read & compare.

* Filter-purpose:-

* Filtering shows only selected data and hides the rest.

used to:-

* Display specific values

* Apply conditions (text, number, date)

* Use custom and advanced filters

* Remove or view duplicates

Benefit:-

* Focus on required information without deleting data.

* Where you find it.

* Data tab → Sort & filter group

* Filter icons appear in column headers.

Conclusion:-

* The Sort & filter options help users manage large datasets efficiently by organizing data logically & viewing only relevant information.

Q 7. how do you apply a custom sort order in excel
A custom sort order allows you to sort data not alphabetically or numerically, but based on a specific order you define.

ex:- sorting days of the week or, priority levels.

steps to apply a custom sort order:-

1. select your data
 - * Include the column you want to sort
 - * make sure headers are present
2. go to the data tab
 - * click sort in the sort & filter group
3. open sort options
 - * In the sort dialog, select the column you want to sort
 - * click order → custom list...
4. choose or create a custom list
 - * excel has default lists like days of the week or months.
 - * or type your own list in the order you want
5. click ok
 - * Then click ok in the sort dialog
 - * Data is sorted according to your custom order.

ex:-

- * column :- priority
- * custom order :- high → medium → low
- * After sorting, all "high" items appear first, then "medium", then "low".

Conclusion:- A custom sort order in excel is useful when you need your data sorted in a specific, non standard sequence, making reports and analysis more meaningful and easier to read.

8. Explain the process of using the Advanced Filter to extract unique records in excel.

* Purpose:-

The Advanced Filter can be used to find unique records in a dataset, helping to remove duplicate without deleting any data.

* Steps to extract unique records

1. Select your data range

* Include column headers

(ex:- A1:C20)

2. go to the Data tab

* click Data → Advanced in the Sort & Filter group

3. Choose the filter type

* In the Advanced Filter dialog, select Filter the List, in-place.

4. Set the List Range

* Enter or select your data range.

5. Leave criteria range blank.

* You don't need criteria for unique records.

6. Check "unique records only".

* This tells Excel to display only unique rows.

7. click ok.

* Excel filters the data and shows only unique records.

* If you chose copy to another location, the unique records appear in the new location you selected.

ex:- original data:-

Name

Raj

Sita

Department

IT

HR

Raj IT
Ramesh Finance

after advanced filter:-

<u>Name</u>	<u>Department</u>
Raj	IT
Sita	HR
Ramesh	Finance

Q. How do you create a filter to show only records that meet multiple criteria?

* method 1:- using auto filter

1. select your data

* Include headers in your dataset

2. enable filter

* go to Data → filter

* small filter arrows appear in each column header.

3. apply filter on first column

* click the first arrow → choose Text filters/Number filters/data filters

* example :- Department = IT

4. apply filter on second column

* click the filter arrow in the second column → set another condition

* example :- salary > 40000

5. Result

* only rows that meet both conditions (AND) will be displayed.

* method 2:- using advanced filter

1. prepare your data

* ensure headers are present

2. create a criteria range

* copy the column headers to an empty area.

* Enter your condition below the headers

* Same row $\rightarrow$ AND logic

* Different rows $\rightarrow$ OR logic

3. Select the data range

4. Go to data $\rightarrow$ advanced

* choose filter the list, in-place or copy to another location.

5. set list range and criteria range

* List range :- your dataset

* criteria range :- The criteria you created.

6. click ok

* excel displays only the rows that meet your multiple criteria.

* example using advanced filter

Data Table :-

Name	Department	Salary
Raj	IT	50000
Sita	HR	45000
Ramesh	IT	35000
Anu	HR	55000

Criteria Range :-

Department	Salary
IT	> 40000

Result :-

Name	Department	Salary
Raj	IT	50000

10x how would you use conditional formatting to identify duplicate values in a range?

* steps to highlight duplicates using conditional formatting

1. select the range of data.

* highlight the columns or cells you want to check for duplicates.

2. go to the home tab

* click home → conditional formatting → highlight cells Rules
→ duplicate values.

3. choose formatting style

* In the dialog box, choose how you want duplicates to be highlighted.

4. click ok

* Excel highlights all duplicate values in the selected range

example:-

original data:-

Name

Raj

Sita

Raj

Ramesh

After conditional formatting:-

* The second occurrence of Raj is highlighted (or both occurrences depending on settings).
